

Building a “real” Android app: the story of CalWatch

Dan S. Wallach (Rice University)

Prof. Wallach's Java chops are rusty

But Comp215 is in Java, and in May 2014, Motorola gave me an idea...

The screenshot shows a news article from 9to5Google. The header reads "9TØ5Google BEYOND GOOD & EVIL" with navigation links for PLUS, ANDROID, CHROME/OS, SEARCH, GOOGLE APPS, GOOGLETV, and YOUTUBE. A comment box says "There is one comment; join the conversation!". The main title is "Motorola asks community to submit Moto 360 watch face designs ahead of launch". Below the title are two images of the Moto 360 smartwatch. The left image shows a watch face with a 24-hour analog clock and digital numbers for hours and minutes. The right image shows a minimalist watch face with only hour markers and a red second hand. On the far left, a vertical bar says "Daily Details". To the right of the watches, there's a sidebar with "CATEGORY: GOOGLE CORPORATE", a photo of Jordan Kahn, and the text "Written by: JORDAN KAHN May 21, 2014 / 8:20 am SHARE 1 COMMENT". There's also a search bar for "SEARCH 9TO5GOOGLE" and social media icons for Facebook and RSS. At the bottom, there are links for "LATEST NEWS 9TØ5Mac" and "Next AT&T introduces longer Next 24 monthly installment program for paying off your iPhone".

Motorola has spent a lot of time since first introducing the Moto 360 talking about how its Android Wear smartwatch will be better than the other guys. That super streamlined watch face it's been

Let's build a watchface for Android Wear!

Initial idea for the Moto 360 contest, ~30 minutes in Photoshop & Illustrator:

Let's build a watchface for Android Wear!

Initial idea for the Moto 360 contest, ~30 minutes in Photoshop & Illustrator:

Android development 101

Android apps are written in Java 7 (no lambdas, no streams)

Download and install Java SE, Android Studio (IntelliJ), and tons of Android SDKs

Start building a basic “Hello World” and work up from there

Android Studio generates lots of boilerplate

You lay out your UI with a graphical tool

Basic Java code to put it together is auto-generated

Android “emulator” is easy to use

Build a fake phone with “AVD” (Android Virtual Device) and configure it right

- “Use host GPU” and use a virtual Intel chip, not ARM

- Install “HAXM” kernel extension

- Runs super fast

activity_my.xml - [app] - Test2 - [/AndroidStudioProjects/Test2] - Android Studio (Beta) 0.9.1

Test2 app src main res layout activity_my.xml

MyActivity.java activity_my.xml ApplicationTest.java MyView.java BuildConfig.java

Project Structure Build Variants Favorites

Palette Layouts: FrameLayout, LinearLayout (Horizontal), LinearLayout (Vertical), TableLayout, TableRow, GridLayout, RelativeLayout. Widgets: Plain TextView, Large Text, Medium Text, Small Text, Button, Small Button, RadioButton, CheckBox, Switch, ToggleButton, ImageButton, ImageView, ProgressBar (Large), ProgressBar (Normal), ProgressBar (Small), ProgressBar (Horizontal), SeekBar, RatingBar, Spinner, WebView. Text Fields: Plain Text, Person Name, Password, Password (Numeric), E-mail, Phone, Postal Address, Multiline Text, Time, Date, Number.

Nexus 5 AppTheme MyActivity API 21

Component Tree: Device Screen > container (LinearLayout) (vertical) > surfaceView (CustomView) - edu.rice.dwallach.test2.surfaceView, textView - "Debug text here", toggleButton (Switch) - "Go?"

Gradle build finished in 1 sec (a minute ago) n/a n/a Git: 9f8d8f9

Commander Gradle Maven Projects

Two days later... (August 13)

Running clock

Second hand ticking at 5Hz

Timezone is wrong

Crashes if you close, rotate, etc.

Total code written

MyActivity.java: 124 lines

MyView.java: 350 lines

XML layout, manifest, etc.: ~60 lines

Ignore Android Wear for now

I didn't have one yet

Easier to test and debug on a phone

Two days later... (August 13)

Running clock

Second hand ticking at 5Hz

Timezone is wrong

Crashes if you close, rotate, etc.

Total code written

MyActivity.java: 124 lines

MyView.java: 350 lines

XML layout, manifest, etc.: ~60 lines

Ignore Android Wear for now

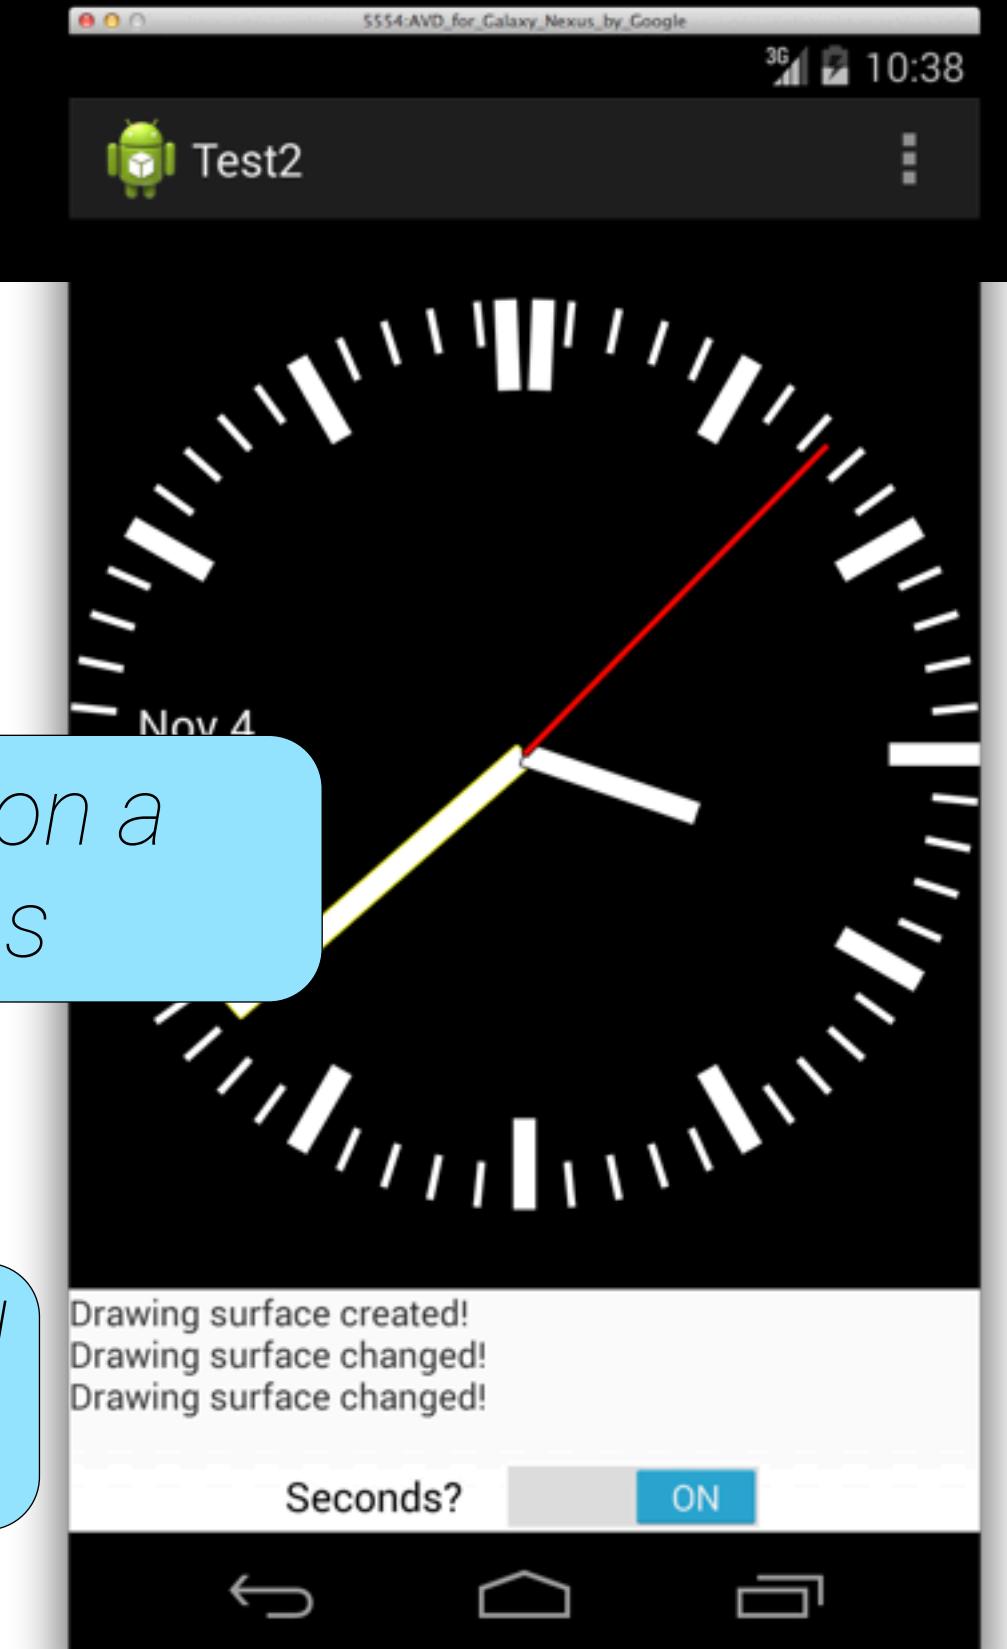

I didn't have one yet

Easier to test and debug on a phone

*"Application
lifecycle"*

*Drawing on a
Canvas*

*Machine generated
(mostly)*

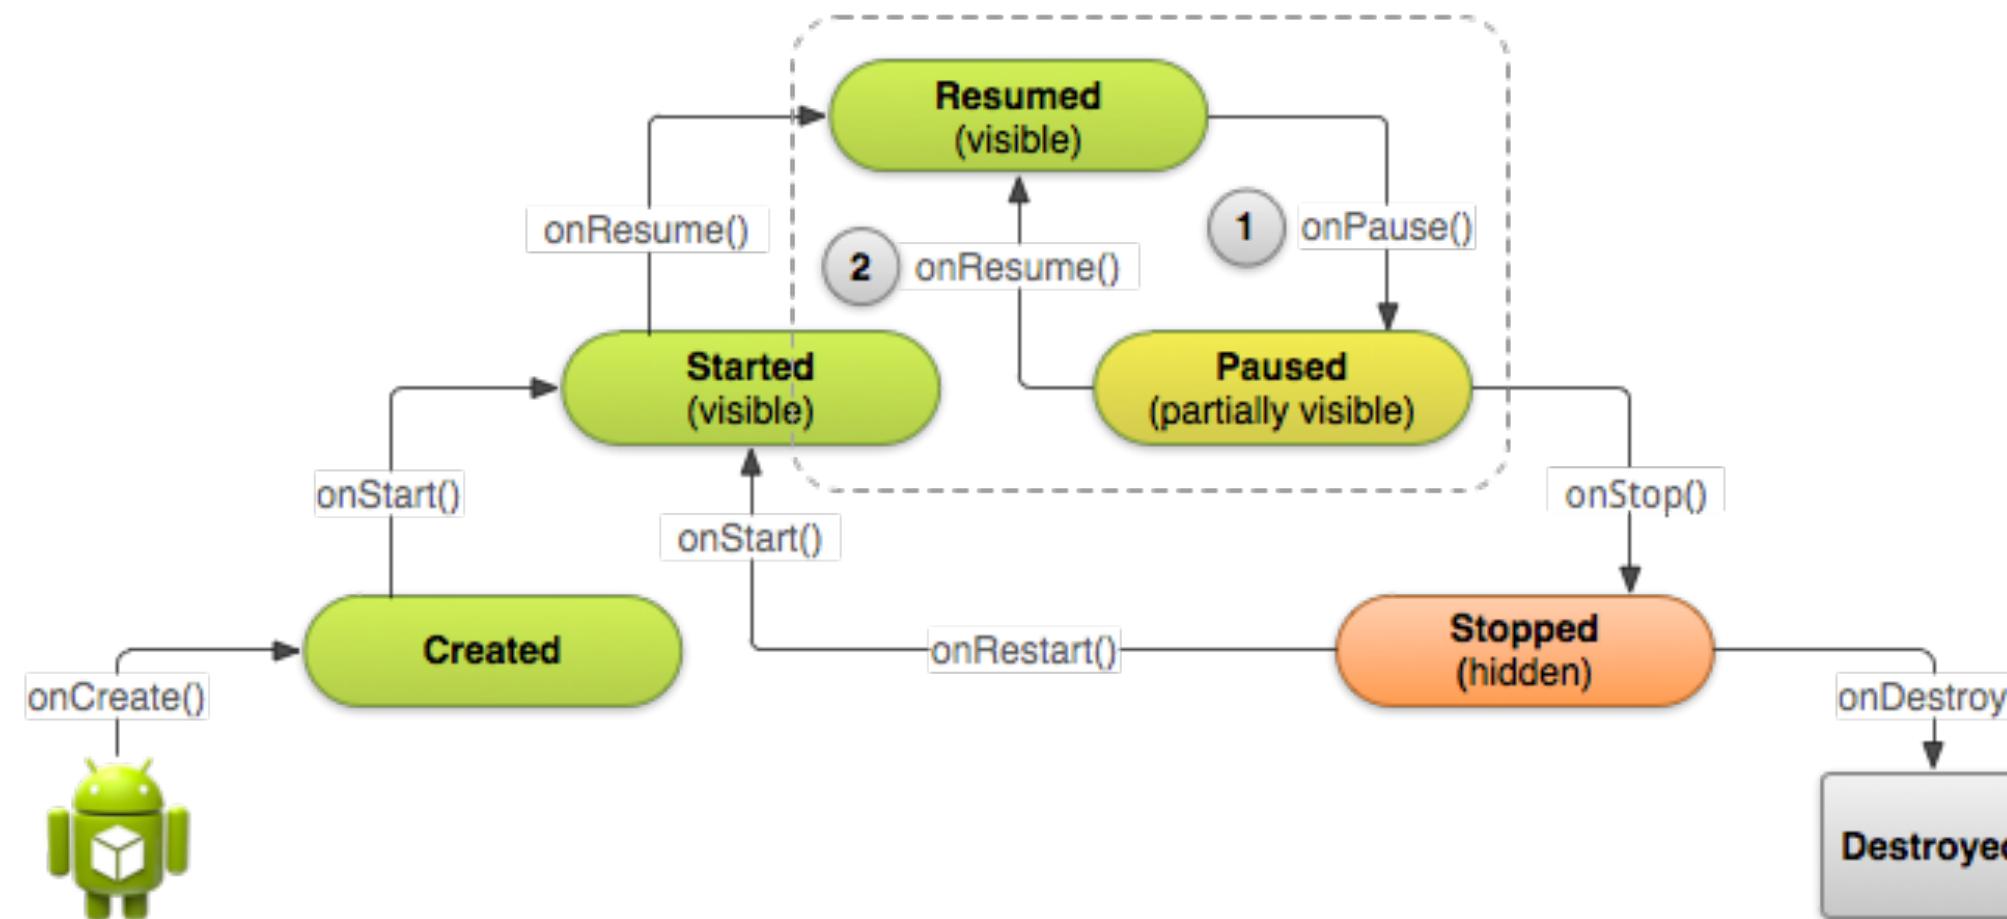

The Android “Application Lifecycle”

You implement a subclass of **Activity** and override a bunch of methods
onCreate, onStart, onStop, onPause, etc.

Callback-style programming

Set everything up, sit back, and wait for the system to call you

Single-threaded UI programming

Blocking is not allowed! Schedule things for the future.

Set “alarms”

Use “animators”

Or, start a separate thread, and deal with multithreading headaches

Pay careful attention to the application lifecycle.

Turn off alarms, kill auxiliary threads, etc.

Hardest thing for me to ultimately debug

Debugging an Android app

Logging, logging, logging!

```
import android.util.Log;  
public class Foo {  
    private static final String TAG = "Foo";  
    ...  
    Log.v(TAG, "something interesting happened here");  
}
```

Logs are captured by Android Studio or by “adb” command line tool

Also, there are apps on the phone that can show you the logs

When your app crashes in the field, logs can be recovered post facto

Note: do not write “private” or user-sensitive info to the logs!

Debugging an Android app

Logging, logging, logging!

```
import android.util.Log;
public class Foo {
    private static final String TAG = "Foo";
    ...
    Log.v(TAG, "something interesting happened here");
}
```

5 log “levels” (verbose, error, info, ...).
See also, *Log.wtf()*

Logs are *Optional 3rd argument: any Exception* **and line tool**
Also, there *(prints stack trace to the log)* **logs**
When your app crashes in the field, logs can be recovered post facto
Note: do not write “private” or user-sensitive info to the logs!

So I wanted to read from the calendar...

```
// first, get the list of calendars
Log.v(TAG, "CalendarFetcher starting to load content");
final String[] calProjection =
    new String[]{
        CalendarContract Calendars._ID,
        CalendarContract Calendars.NAME,
        CalendarContract Calendars.ACCOUNT_NAME,
        CalendarContract Calendars.ACCOUNT_TYPE,
        CalendarContract Calendars.CALENDAR_COLOR,
        CalendarContract Calendars.CALENDAR_COLOR_KEY,
        CalendarContract Calendars.VISIBLE
    };
Cursor calCursor = ctx.getContentResolver().
    query(CalendarContract Calendars.CONTENT_URI,
          calProjection,
          CalendarContract Calendars.VISIBLE + " = 1",
          null,
          CalendarContract Calendars._ID + " ASC");

int calendarsFound = 0;

if (calCursor.moveToFirst()) {
    do {
        int i = 0;
        CalendarResults.Calendar cal =
            new CalendarResults.Calendar();
        cal.ID = calCursor.getInt(i++);
        cal.name = calCursor.getString(i++);
        cal.accountName = calCursor.getString(i++);
        cal.accountType = calCursor.getString(i++);
        cal.calendarColor = calCursor.getInt(i++);
        cal.calendarColorKey = calCursor.getString(i++);
        cal.visible = (calCursor.getInt(i++) != 0);
        // Log.v(TAG, "Found calendar. ID(" + cal.ID + "), name(" +
        + cal.name + "), color(" + Integer.toHexString(cal.calendarColor) + ""),
        colorKey(" + cal.calendarColorKey + "), accountName(" + cal.accountName +
        "), visible(" + Boolean.toString(cal.visible)+ ")");
        cr.calendars.put(cal.ID, cal);
        calendarsFound++;
    }
    while (calCursor.moveToNext());
}
Log.v(TAG, "calendars found (" + calendarsFound + ")");
calCursor.close();
```

So I wanted to read from the calendar...

```
// first, get the list of calendars
Log.v(TAG, "CalendarFetcher starting to load content");
final String[] calProjection =
    new String[]{
        CalendarContract.Calendars._ID,
        CalendarContract.Calendars.NAME,
        CalendarContract.Calendars.ACCOUNT_NAME,
        CalendarContract.Calendars.ACOUNT_TYPE,
        CalendarContract.Calendars.CALENDAR_COLOR,
        CalendarContract.Calendars.CALENDAR_COLOR_KEY,
        CalendarContract.Calendars.VISIBLE
    };
Cursor calCursor = ctx.getContentResolver().
    query(CalendarContract.Calendars.CONTENT_URI,
        calProjection,
        CalendarContract.Calendars.VISIBLE + " = 1",
        null,
        CalendarContract.Calendars._ID + " ASC");

int calendarsFound = 0;
```

Building a SQL query

Context: your Activity (or equiv.)

```
if (calCursor.moveToFirst()) {
    do {
        cal.name = calCursor.getString(i++);
        cal.accountName = calCursor.getString(i++);
        cal.accountType = calCursor.getString(i++);
        cal.calendarColor = calCursor.getInt(i++);
        cal.calendarColorKey = calCursor.getString(i++);
        cal.visible = (calCursor.getInt(i++) != 0);
        // Log.v(TAG, "Found calendar. ID(" + cal.ID + "), name(" +
        + cal.name + "), color(" + Integer.toHexString(cal.calendarColor) + ""),
        colorKey(" + cal.calendarColorKey + "), accountName(" + cal.accountName +
        "), visible(" + Boolean.toString(cal.visible)+ ")");
        cr.calendars.put(cal.ID, cal);
        calendarsFound++;
    }
    while (calCursor.moveToNext());
}
Log.v(TAG, "calendars found ("+ calendarsFound + ")");
calCursor.close();
```

So I wanted to read from the calendar...

```
// first, get the list of calendars
Log.v(TAG, "CalendarFetcher starting to load content");
final String[] calProjection =
    new String[]{
        CalendarContract.Calendars._ID,
        CalendarContract.Calendars.VISIBLE,
        CalendarContract.Calendars.CONTENT_URI,
        calProjection,
        CalendarContract.Calendars.VISIBLE + " = 1",
        null,
        CalendarContract.Calendars._ID + " ASC");

int calendarsFound = 0;

if (calCursor.moveToFirst()) {
    do {
        int i = 0;
        CalendarResults.Calendar cal =
            new CalendarResults.Calendar();

        cal.ID = calCursor.getInt(i++);
        cal.name = calCursor.getString(i++);
        cal.accountName = calCursor.getString(i++);
        cal.accountType = calCursor.getString(i++);
        cal.calendarColor = calCursor.getInt(i++);
        cal.calendarColorKey = calCursor.getString(i++);
        cal.visible = (calCursor.getInt(i++) != 0);
        // Log.v(TAG, "Found calendar. ID(" + cal.ID + "), name(" +
        //      + cal.name + "), color(" + Integer.toHexString(cal.calendarColor) +
        //      colorKey(" + cal.calendarColorKey + "), visible(" + Boolean.toString(cal.visible) + ")");
        cr.calendars.put(cal);
        calendarsFound++;
    }
    while (calCursor.moveToNext());
}
Log.v(TAG, "calendars found ("+ calendarsFound + ")");

calCursor.close();
```

Load results into my own data structure

Don't forget to clean up afterwards

How do you figure all this out?

Google searches, StackOverflow searches, much head scratching

Initially, I was querying the full calendar

Found an open-source library for dealing with RFC 2245 “recurring events”

Didn’t always work (solved for real later; *stay tuned...*)

Save URLs in code comments

grep http *.java → 17 different places where I borrowed ideas and code

Warning: much advice on the Internet is incomplete or flat-out wrong

Overlapping calendar events

Initial thought: design a greedy algorithm

For each event: If no overlap with prior events, insert and we're done

If there is overlap, then add a “new level” and squish overlapping events

Stretch prior inserted events to fill these new levels

Analysis: $O(n^3)$ worst case (if they all overlap), but n is small

Mostly worked, but obscure bugs and layout wasn't pretty

Good enough for now, fix it later (*stay tuned...*)

Time to port the code to run on Android Wear

Code size, August 24, 2014 (before Wear port)

CalendarFetcher.java 417 lines

CalendarResults.java 95 lines

ClockFace.java 574 lines

EventLayout.java 137 lines

MyActivity.java 245 lines

MyViewAnim.java 300 lines

miscellaneous Java 47 lines

XML files 158 lines

Total 1973 lines

Graphics code now in a separate class; Added graphics code for the pie wedges

Running the graphics in a separate thread, many headaches

Android Wear: It's just Android

APIs for implementing a “watchface” were undefined; start with an “app”

My app was running immediately on the watch emulator

New “layout” (XML) and minor tweaks, but it ran right away

There's a CalendarProvider on the watch, but it returns no calendars, no events

New engineering necessary: build a phone → watch data path

Two choices: DataAPI or MessageAPI (both over Bluetooth)

DataAPI: key/value store, synchronized magically (eventually)

MessageAPI: here's an array of bytes, get it over there or fail now

How to send calendar data?

DataAPI key/value store doesn't handle object-arrays

Need reliable, simple serialization

Protocol buffers to the rescue!

Invented by Google, widely supported, efficient, compact, extensible, ...

Compact open-source “Wire” library from Square, engineered for Android

```
message WireEvent {  
    required int64 startTime = 1;  
    required int64 endTime = 2;  
    required int32 displayColor = 3;  
}  
  
message WireUpdate {  
    repeated WireEvent events = 1;  
    required bool newEvents = 2; // true: the events are new, have a look; false: ignore the events field  
    required int32 faceMode = 3; // display mode: ClockState.FACE_TOOL, FACE_NUMBERS, FACE_LITE  
    required bool showSecondHand = 4;  
    required bool showDayDate = 5;  
}
```

How to send calendar data?

Data API key/value store doesn't handle object-arrays

Need reliable, simple serialization

Protocol buffers to the rescue!

Invented by Google, widely supported, efficient, compact, extensible, ...

Compact open-source “Wire” library from Square engineered for Android

```
message WireEvent {  
    required int64 startTime = 1;  
    required int64 endTime = 2;  
  
    public byte[] getProtobuf() {  
        WireUpdate wireUpdate = new WireUpdate(getWireEventList(), true, getFaceMode(), getShowSeconds(), getShowDayDate());  
        byte[] output = wireUpdate.toByteArray();  
  
        return output;  
    }  
}
```

Constructor to build the data structure (auto-generated)

List<WireEvent>

Boom! Bytes ready to send.

11 calendar events → 250 bytes

Activities vs. Services

Activities (you run them, you see them)

Services (operate in the background)

Both can run in the same process, share the same UI thread.

Services can continue running even when the app isn't visible.

Android might kill your Activity but leave your Service running.

Services can automatically start at boot time.

We want to feed calendar data from the phone to the watch, even if the user hasn't started the app!

Refactor code to have a service interacting with the calendar provider

Shared state: Activity (on phone) just sees new data to render

Networking: Serialize the state and send it to the watch

Manifest.XML - where it all begins

```
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="org.dwallach.calwatch">

    <uses-feature android:name="android.hardware.type.watch"
        android:required="false"/>

    <uses-permission android:name="android.permission.READ_CALENDAR" />
    <uses-permission android:name="android.permission.WAKE_LOCK" />
    <uses-permission android:name="android.permission.RECEIVE_BOOT_COMPLETED" />
    <uses-permission android:name="android.permission.READ_EXTERNAL_STORAGE" />
    <uses-permission android:name="android.permission.WRITE_EXTERNAL_STORAGE" />
    <uses-permission
        android:name="com.google.android.permission.PROVIDE_BACKGROUND" />

    <application
        android:allowBackup="true"
        android:icon="@drawable/ic_launcher"
        android:label="@string/app_name"
        android:theme="@style/AppTheme">

        <meta-data android:name="com.google.android.gms.version"
            android:value="@integer/google_play_services_version" />

Gradle build system

make → ant → maven → gradle → ...

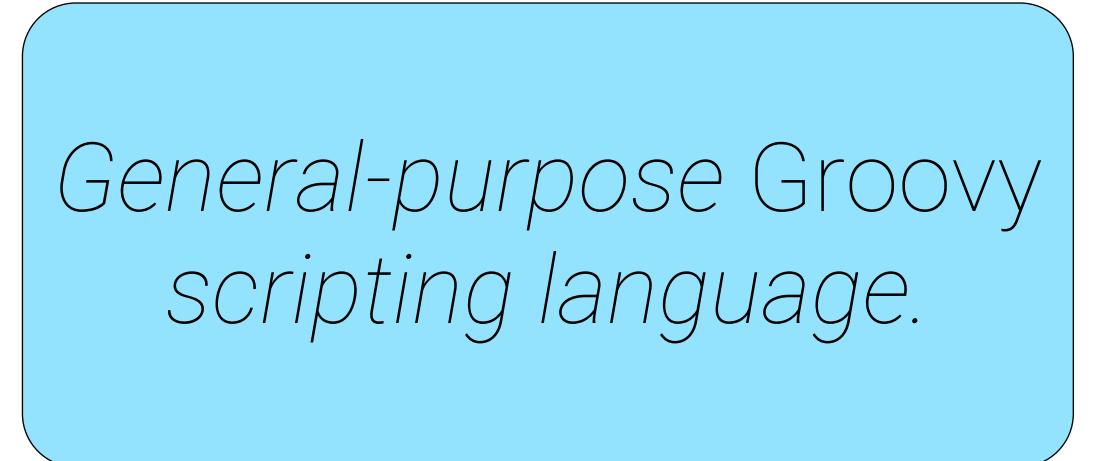

Gradle is this week's current trendy build system; it has some cool features

```
dependencies {  
    compile fileTree(dir: 'libs', include: ['*.jar'])  
    compile 'com.squareup.wire:wire-runtime:1.5.1'  
}
```

*Go find the library out
there, somewhere, and
link it in for me.*

```
def getVersionName = { ->  
    try {  
        def stdout = new ByteArrayOutputStream()  
        exec {  
            commandLine 'git', 'describe', '--tags', '--dirty'  
            standardOutput = stdout  
        }  
        return stdout.toString().trim()  
    }  
    catch (ignored) {  
        return null;  
    }  
}
```

*General-purpose Groovy
scripting language.*

Debugging

Paranoid engineering?

Tons of paranoid code throughout the codebase, e.g.:

```
public void onConnected(Bundle connectionHint) {
    Log.v(TAG, "connected to Google API!");
    readyToSend = true;

    // shouldn't ever happen, but might explain the weird null pointer exceptions that rarely show up in the logs
    if(googleApiClient == null) {
        Log.e(TAG, "unexpected null googleApiClient");
        cleanup();
        initGoogle();
        return;
    }

    try {
        Wearable.MessageApi.addListener(googleApiClient, this);
    } catch (NullPointerException e) {
        Log.e(TAG, "unexpected failure in onConnected (googleApiClient = " + googleApiClient + ")", e);
        cleanup();
        initGoogle();
        return;
    }

    sendAllToWatch();
}
```

Paranoid engineering?

Tons of paranoid code throughout the code

```
public void onConnected(Bundle connectionHint) {
    Log.v(TAG, "connected to Google API!");
    readyToSend = true;

    // shouldn't ever happen, but might explain the weird logs
    if(googleApiClient == null) {
        Log.e(TAG, "unexpected null googleApiClient");
        cleanup();
        initGoogle();
        return;
    }

    try {
        Wearable.MessageApi.addListener(googleApiClient, this);
    } catch (NullPointerException e) {
        Log.e(TAG, "unexpected failure in onConnected (googleApiClient = " + googleApiClient + ")", e);
        cleanup();
        initGoogle();
        return;
    }

    sendAllToWatch();
}
```

This is the callback once we're "connected" to the Google API.

Paranoid engineering?

Tons of paranoid code throughout the codebase, e.g.:

```
public void onConnected(Bundle connectionHint) {  
    Log.v(TAG, "connected to Google API!");  
    readyToSend = true;  
  
    // shouldn't ever happen, but might explain the weird null pointer exceptions that rarely show up in the logs  
    if(googleApiClient == null) {  
        Log.e(TAG, "unexpected null googleApiClient");  
        cleanup();  
        initGoogle();  
        return;  
    }  
  
    try {  
        Wearable.MessageApi.addListener(googleApiClient, t  
    } catch (NullPointerException e) {  
        Log.e(TAG, "unexpected failure in onConnected (go  
        cleanup();  
        initGoogle();  
        return;  
    }  
  
    sendAllToWatch();  
}
```

But this rarely blows up with a
NullPointerException. Which
shouldn't happen.

Paranoid engineering?

Tons of paranoid code throughout the codebase, e.g.:

```
public void onConnected(Bundle connectionHint) {
    Log.v(TAG, "connected to Google API!");
    readyToSend = true;

    // shouldn't ever happen, but might explain the weird logs
    if(googleApiClient == null) {
        Log.e(TAG, "unexpected null googleApiClient",
              "onConnected(" + connectionHint + ")");
        cleanup();
        initGoogle();
        return;
    }

    try {
        Wearable.MessageApi.addListener(googleApiClient, this);
    } catch (NullPointerException e) {
        Log.e(TAG, "unexpected failure in onConnected (googleApiClient = " + googleApiClient + ")", e);
        cleanup();
        initGoogle();
        return;
    }

    sendAllToWatch();
}
```

Paranoia 1: maybe googleApiClient was null (which shouldn't happen).

Paranoia 2: try to clean up and reconnect.

Finally, I got my LG G Watch in the mail

Found bugs that I didn't find in the emulator

Tweaks to the graphics to look good on the watch (shadows, font size, ...)

Integrated sample code (reverse-engineered) to run as a real watchface

Extra work to deal with “ambient” mode

No documentation from Google at all

Many, many fixes to lifecycle bugs

Example: what if the watchface restarts and there's no connected phone?

Solution: use persistent state to remember old calendar data

Tweak graphics for the “flat tire” bottom of the Moto 360

Performance & profiling

Rule #1: Don't.

Rule #2: Profile your code.

`android.os.Debug.startMethodTracing()`

Run ~60 seconds, stop, get giant dump, run in analysis tool

Also useful: compute min/mean/max frame rendering times, report in log

Tentative observations:

Recomputing day/date (“Nov 4”) on every redraw is surprisingly expensive

Caching this result not only sped up redraws, but also eliminated most garbage collection events

Recomputing the geometry of the watch face is also dumb

Canvas lets you “cache” this in a Path, which you can reuse on subsequent frames

Results? Running at 40+ Hz, using <30% of available CPU time

Folk wisdom:

Keep your `onDraw()` method lean (no memory allocation, etc.)

Alpha 1 “release”: September 15, 2014

First point that I’m willing to generate an APK, show others. Still buggy.

CalendarFetcher.java	417→449 lines	WatchCalendarService.java	213 lines
CalendarResults.java	95→116 lines	WearSender.java	148 lines

miscellaneous Java	47→76 lines	WearReceiverService.java	196 lines
XML files	Shared code across phone & watch 1973→3555 lines		

Subsequent fixes: lots and lots of bugs

Reading the calendar. Properly.

“Instances” not “events”

CalendarFetcher.java: 449 → 275 lines, and no more recurring-event bugs

Removed RFC2245 library, no longer necessary

Observation: led astray by calendar code on the Internet, fixed by careful reading of the Android API documentation.

And yet more subtle bugs fixed with the app lifecycle.

Maybe once-a-day crashes? Run to a computer and extract logs. Repeat.

Observation: Easy to get running. Hard to nail down weird bugs.

Exasperation: Pasting together bits of code from the Internet is dangerous.

Calendar event layout misbehavior

Weird corner cases where the layout just didn't work right

Attempt #1: Unit testing and careful engineering

Android has unit testing support. The event layout engine is easy to test on its own.

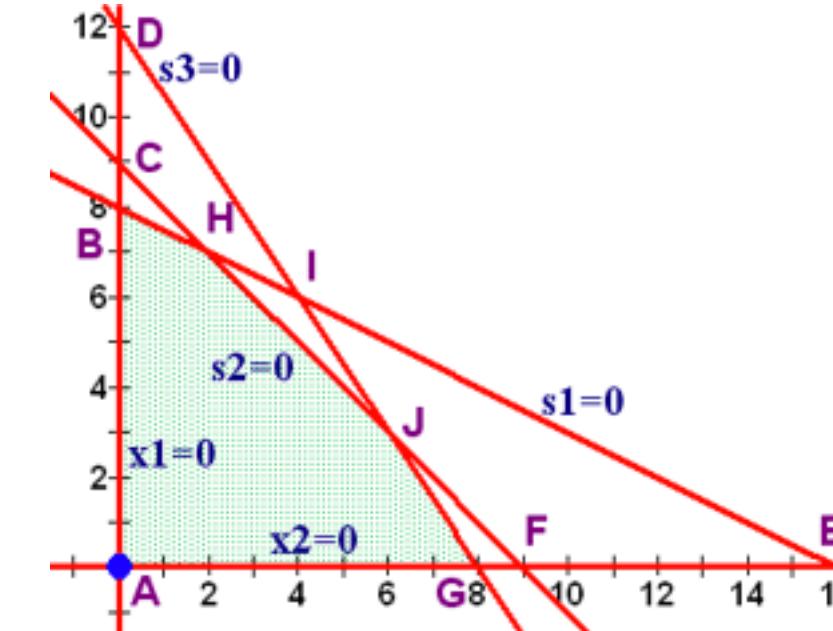

Hypothesis: My greedy algorithm is the wrong solution. Need to treat like a system of equations or springs.

Insight: Computer science to the rescue. Linear constraint solvers!

Simplex method is decades old

Exponential worst case, fast in practice

Picked the Cassowary solver (Java, open source)

Using a solver is easy

```
ClLinearExpression sumSizes = new ClLinearExpression(0.0);
for (i = 0; i < nEvents; i++) {
    sumSizes = sumSizes.plus(sizes[i]);
    for (j = i + 1; j < nEvents; j++) {
        if (events.get(i).overlaps(events.get(j))) {
            // constraint: base level + its size < base level of next dependency
            ClLinearExpression levelPlusSize = new ClLinearExpression(startLevels[i]).plus(sizes[i]);
            ClLinearInequality liq = new ClLinearInequality(levelPlusSize, CL.LEQ, startLevels[j],
                ClStrength.required);
            solver.addConstraint(liq);

            // weak constraint: constrained segments should have the same size (0.5x weight of other weak constraints)
            ClLinearEquation eqSize = new ClLinearEquation(sizes[i], new ClLinearExpression(sizes[j]),
                ClStrength.weak, 0.5);
            solver.addConstraint(eqSize);
        }
    }
}

// constraint: the sum of all the sizes is greater than the maximum it could ever be under the absolute best of cases
// (this constraint's job is to force us out of degenerate cases when the solver might prefer zeros everywhere)
ClLinearInequality sumSizesEq = new ClLinearInequality(sumSizes, CL.GEQ, new ClLinearExpression(MAXLEVEL*nEvents),
    ClStrength.weak);
solver.addConstraint(sumSizesEq);
```

Using a solver is easy

```
ClLinearExpression sumSizes = new ClLinearExpression(0.0);
for (i = 0; i < nEvents; i++) {
    sumSizes = sumSizes.plus(sizes[i]);
    for (j = i + 1; j < nEvents; j++) {
        if (events.get(i).overlaps(events.get(j))) {
            // constraint: base level + its size < base level of next dependency
            ClLinearExpression levelPlusSize = new ClLinearExpression(startLevels[i]).plus(sizes[i]);
            ClLinearInequality liq = new ClLinearInequality(levelPlusSize, CL.LEQ, startLevels[j],
                ClStrength.required);
            solver.addConstraint(liq);

            // weak constraint: constrained segments should have the same size (0.5x weight of other weak constraints)
            ClLinearEquation eqSize = new ClLinearEquation(sizes[i] - new ClLinearExpression(sizes[j]),
                ClStrength.weak, 0.5);
            solver.addConstraint(eqSize);
        }
    }
}

// constraint: the sum of all the sizes must be at least the absolute best case
// (this constraint's job is to force us out of degenerate cases when the solver might prefer zeros everywhere)
ClLinearInequality sumSizesEq = new ClLinearInequality(sumSizes, CL.GEQ, new ClLinearExpression(MAXLEVEL*nEvents),
    ClStrength.weak);
solver.addConstraint(sumSizesEq);
```

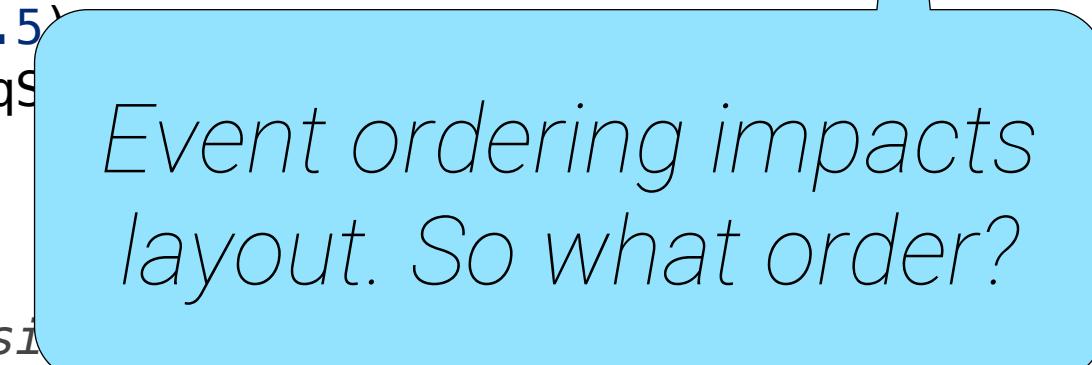

Each event has a **start** and a **size**. Constrain them when overlapping.

Using a solver is easy

```
ClLinearExpression sumSizes = new ClLinearExpression(0.0);
for (i = 0; i < nEvents; i++) {
    sumSizes = sumSizes.plus(sizes[i]);
    for (j = i + 1; j < nEvents; j++) {
        if (events.get(i).overlaps(events.get(j))) {
            // constraint: base level + its size < base level of next dependency
            ClLinearExpression levelPlusSize = new ClLinearExpression(startLevels[i]).plus(sizes[i]);
            ClLinearInequality liq = new ClLinearInequality(levelPlusSize, CL.LEQ, startLevels[j],
                ClStrength.required);
            solver.addConstraint(liq);

            // weak constraint: constrained segments should have the same size (0.5x weight of other weak constraints)
            ClLinearEquation eqSize = new ClLinearEquation(sizes[i] - new ClLinearExpression(sizes[j]),
                ClStrength.weak, 0.5);
            solver.addConstraint(eqSize);
        }
    }
}

// constraint: the sum of all the sizes must be at least the max level ever be under the absolute best of cases
// (this constraint's job is to force us out of degenerate cases when the solver might prefer zeros everywhere)
ClLinearInequality sumSizesEq = new ClLinearInequality(sumSizes, CL.GEQ, new ClLinearExpression(MAXLEVEL*nEvents),
    ClStrength.weak);
solver.addConstraint(sumSizesEq);
```

Event ordering impacts layout. So what order?

Event sorting: for consistency + aesthetics

```
// Primary sort: color, so events from the same calendar will become consecutive wedges

// Secondary sort: endTime, with objects ending earlier appearing first in the sort.
// (goal: first fill in the outer ring of the display with smaller wedges; the big
// ones will end late in the day, and will thus end up on the inside of the watchface)

// Third-priority sort: startTime, with objects starting later (smaller) appearing first in the sort.

Collections.sort(cr.instances, new Comparator<CalendarResults.Instance>() {
    public int compare(CalendarResults.Instance lhs, CalendarResults.Instance rhs) {
        if(lhs.displayColor != rhs.displayColor)
            return Long.compare(lhs.displayColor, rhs.displayColor);

        if(lhs.endTime != rhs.endTime)
            return Long.compare(lhs.endTime, rhs.endTime);

        return Long.compare(rhs.startTime, lhs.startTime);
    }
});
```

Solver performance?

In typical use, the solver runs for <100ms (on the watch with ~10 events).

Overkill: re-running the solver with even n position swaps (never mind $n!$ total reorderings) could explode the solver time. Not acceptable. (And maybe the current scheme looks better than a packing-optimal one.)

The result is cached.

The cache is only invalidated once per hour or if new calendar data arrives.

And it looks great. Conclusion? Problem solved.

Time to let more people play with it!

“Private” beta

September 24, 2014

Invited personal friends

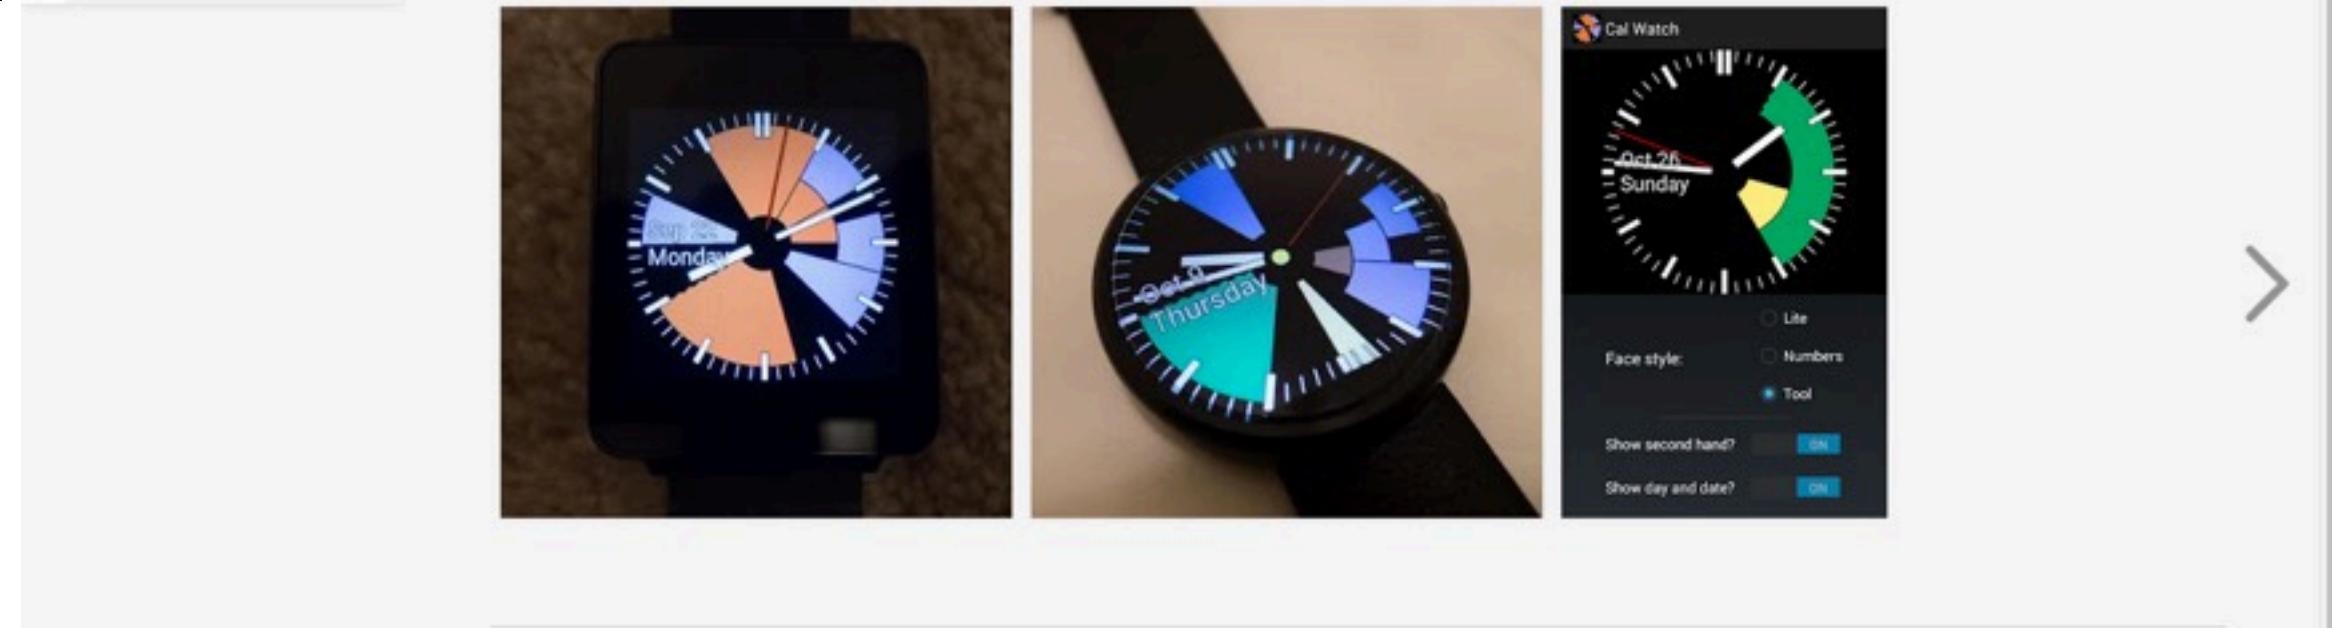

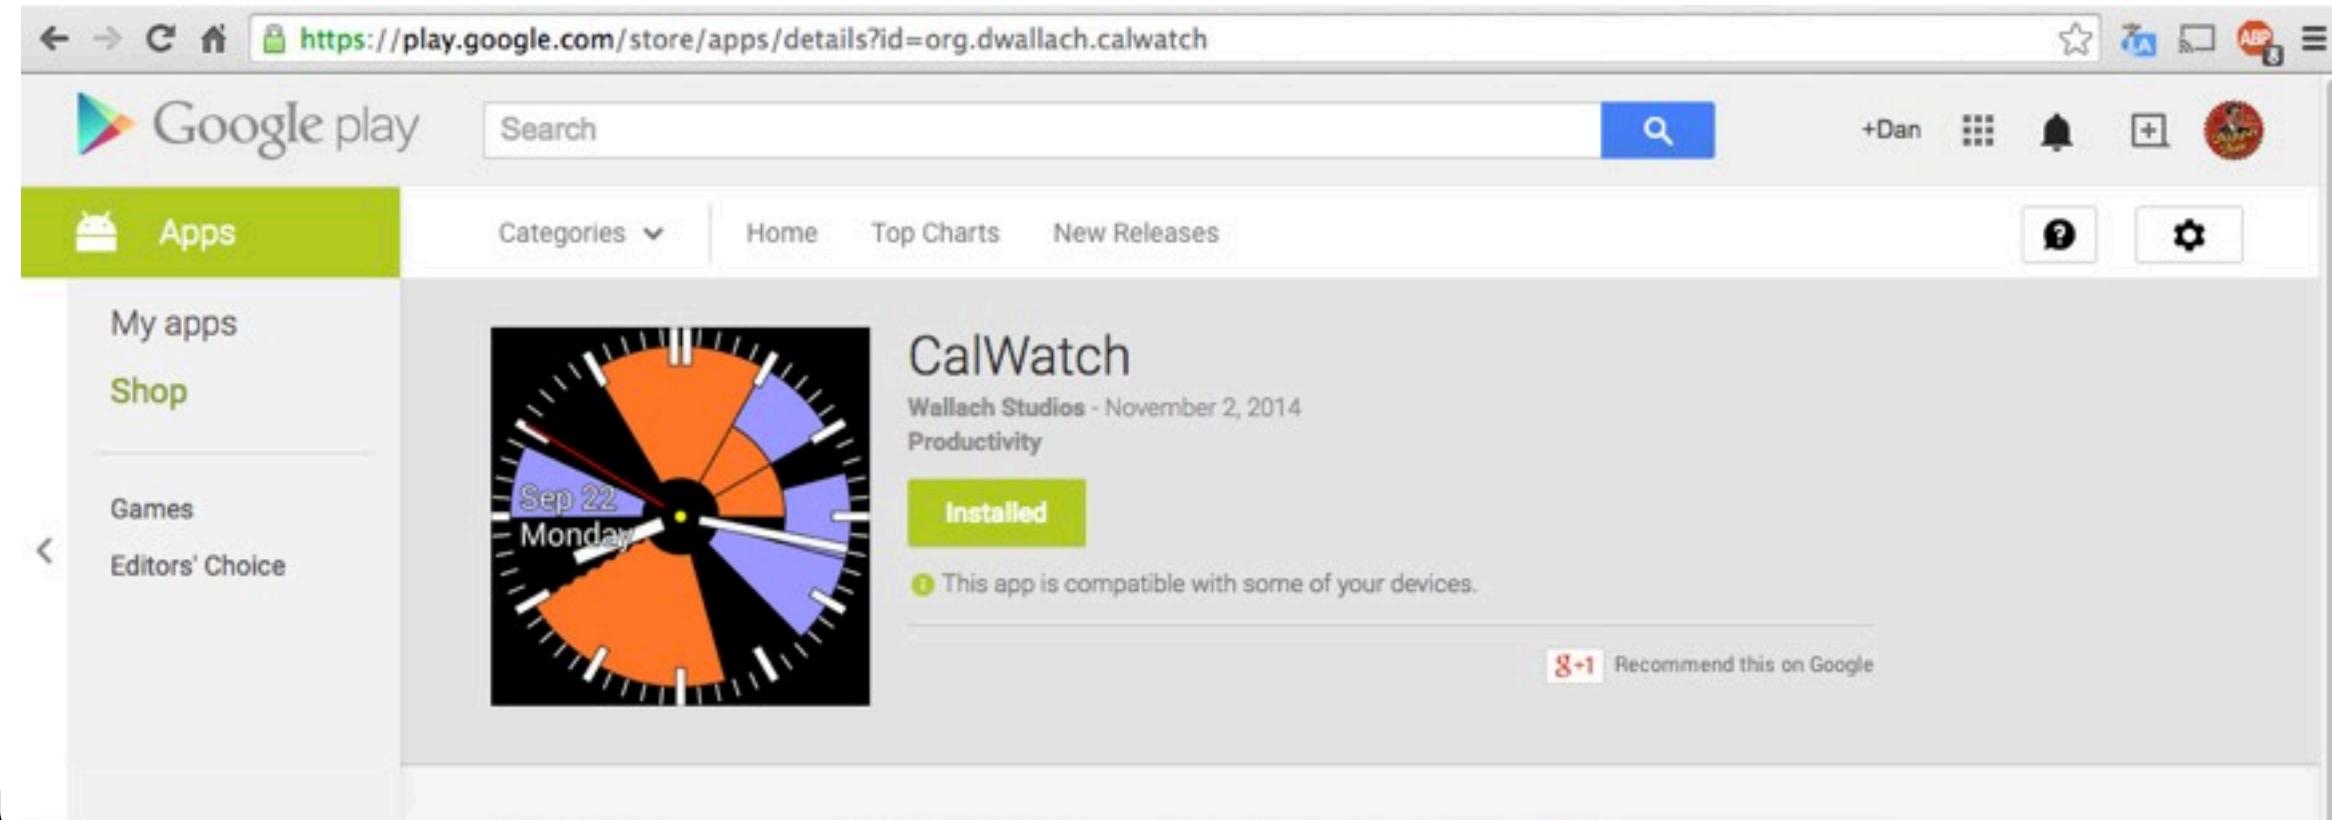

Found more bugs

Eventually “public” beta

G+ Community: “Android Wear Developers”

Picked up 30-40 users

Little useful bug feedback

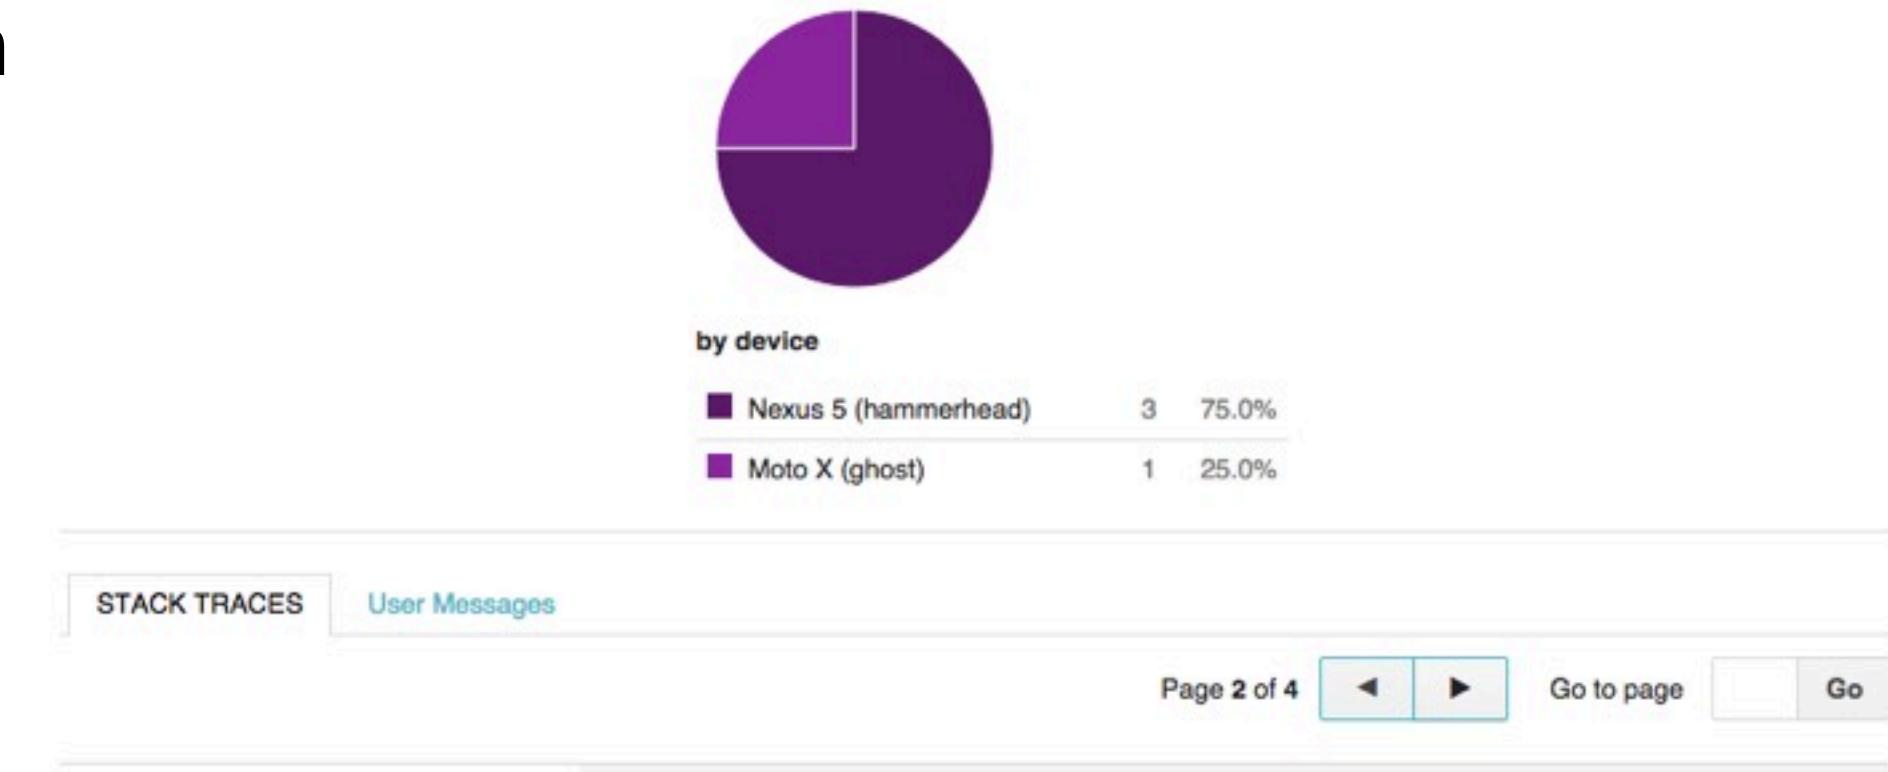

Play Store bug reporting

When the app fails, the user can report it. It goes to the Play dev console.

Sadly, logs aren't included.

Also, doesn't seem to include on-watch crashes.

Better error reporting is available with Crashalytics library, but network permissions are required.

I don't want network permissions!

Play Store bug reporting

When the app fails, the user can report it. It goes to the Play dev console.

Sadly, logs aren't included.

Also, doesn't seem to include on-watch crashes.

Better error reporting is available with Crashalytics library, but network permissions are required.

I don't want network permissions!

Later on: open-source to the rescue.

<https://github.com/PomepuyN/AndroidWearCrashReport>

Finally, I think I nailed it

Careful attention to the Android SDK documents for lifecycle events

But zero documentation for watchfaces, so it's a guessing game

Careful attention to multithreaded discipline

Simultaneous redrawing from two threads will (rarely) crash the whole watch

→ If the draw thread is active, suppress redraws from elsewhere

Many bugs found/fixed specifically for the Moto 360

Different behavior for “ambient” mode, etc.

Try/catch blocks everywhere

35 try blocks across ~4700 lines of code

Minor stuff

Android 5 “material design” widgets, if the phone is running Android 5

Proper handling of daylight savings time

Finally, I think I nailed it

Careful attention to the Android SDK documents for lifecycle events

But zero documentation for watchfaces, so it's a guessing game

Careful attention to multithreaded discipline

Simultaneous redrawing from two threads will (rarely) crash the whole watch

→ If the draw thread is active, suppress redraws from elsewhere

Many bugs found/fixed specifically for the Moto 360

Different behavior for “ambient” mode, etc.

Try/catch blocks everywhere

35 try blocks across ~4700 lines of code

Minor stuff

Android 5 “material design” widgets. if the phone is running Android 5

Later on: official Android Watchface API eliminated all need for multithreading.

Beta 11 release: November 2, 2014

This time, for sure. No, really. (Line counts relative to alpha 1.)

CalendarFetcher.java	449→296 lines	WatchCalendarService.java	213→137 lines
CalendarResults.java	116→62 lines	WearSender.java	148→179 lines
ClockFace.java	755→771 lines	BatteryMonitor.java	78→83 lines
EventLayout.java	160→160 lines	ClockState.java	251→296 lines
PhoneActivity.java	246→407 lines	TimeWrapper.java	115→204 lines
MyViewAnim.java	302→507 lines	WearActivity.java	241→371 lines
misc Java + unit tests	76→304 lines	WearReceiverService.java	196→256 lines
XML files	283→455 lines	EventLayoutUniform.java	128 lines
<hr/>		Total	3555→4746 lines

As of late 2014...

Very rare misbehaviors. Stab-in-the-dark code to catch them.

E.g., Rarely, the event loop keeps running even after I kill it.

Reading over the logcat, some evidence of subtle Android system bugs.

Messages about running out of file descriptors.

Could be me leaking memory, object finalizers not running.

Only seems to happen multiple days after the app starts running.

Recovery after a crash is at least solid.

User sees “*Unfortunately, CalWatch has stopped working. [Ok]*”.

Single click and it’s back again like nothing happened.

As of late 2015...

Google *finally* announced real APIs for building watchfaces

I was able to delete a bunch of code!

Plus lots of new features, like “interactive” watchfaces

Also added a copy of the calendar on the watch (no need for me to send it!)

I also wrote a stopwatch app that communicates with my watchface

“Binder” IPC system: any app can “subscribe” to my stopwatch

Newer versions of Android Studio have sophisticated static checking

Specifically identifies common bug patterns among Android devs

Example: You use anon. inner classes to handle callbacks, but they’re also closures.

This can keep everything from being garbage collected when the app is being shut down.

Final code size numbers (release3e)

(Line counts relative to alpha 1.)

CalendarFetcher.java	449→310 lines	WatchCalendarService.java	213→0 lines
CalendarResults.java	116→0 lines	WearSender.java	148→182 lines
ClockFace.java	755→1083 lines	BatteryMonitor.java	78→91 lines
EventLayout.java	160→166 lines	ClockState.java	251→294 lines
PhoneActivity.java	246→221 lines	TimeWrapper.java	115→192 lines
MyViewAnim.java	302→216 lines	WearActivity.java	241→276 lines
misc Java + unit tests	76→576 lines	WearReceiverService.java	196→245 lines
XML files	283→386 lines	EventLayoutUniform.java	134 lines
Stopwatch IPC support	0→203 lines	Total	3555→4787 lines

What's next?

Need to test with other languages and locales

Right-to-left (Arabic, Farsi, Hebrew, ...) will be fun to test and debug

At least Android has good support for internationalization and localization

Open source?

Dual license: it's easy to share (GPLv3) and license commercially

<http://www.cs.rice.edu/~dwallach/calwatch/>

<https://github.com/danwallach/CalWatch>

Was it worth it?

Late 2014/early 2015:

“Big” rush of users

Fixed lots of bug fixes

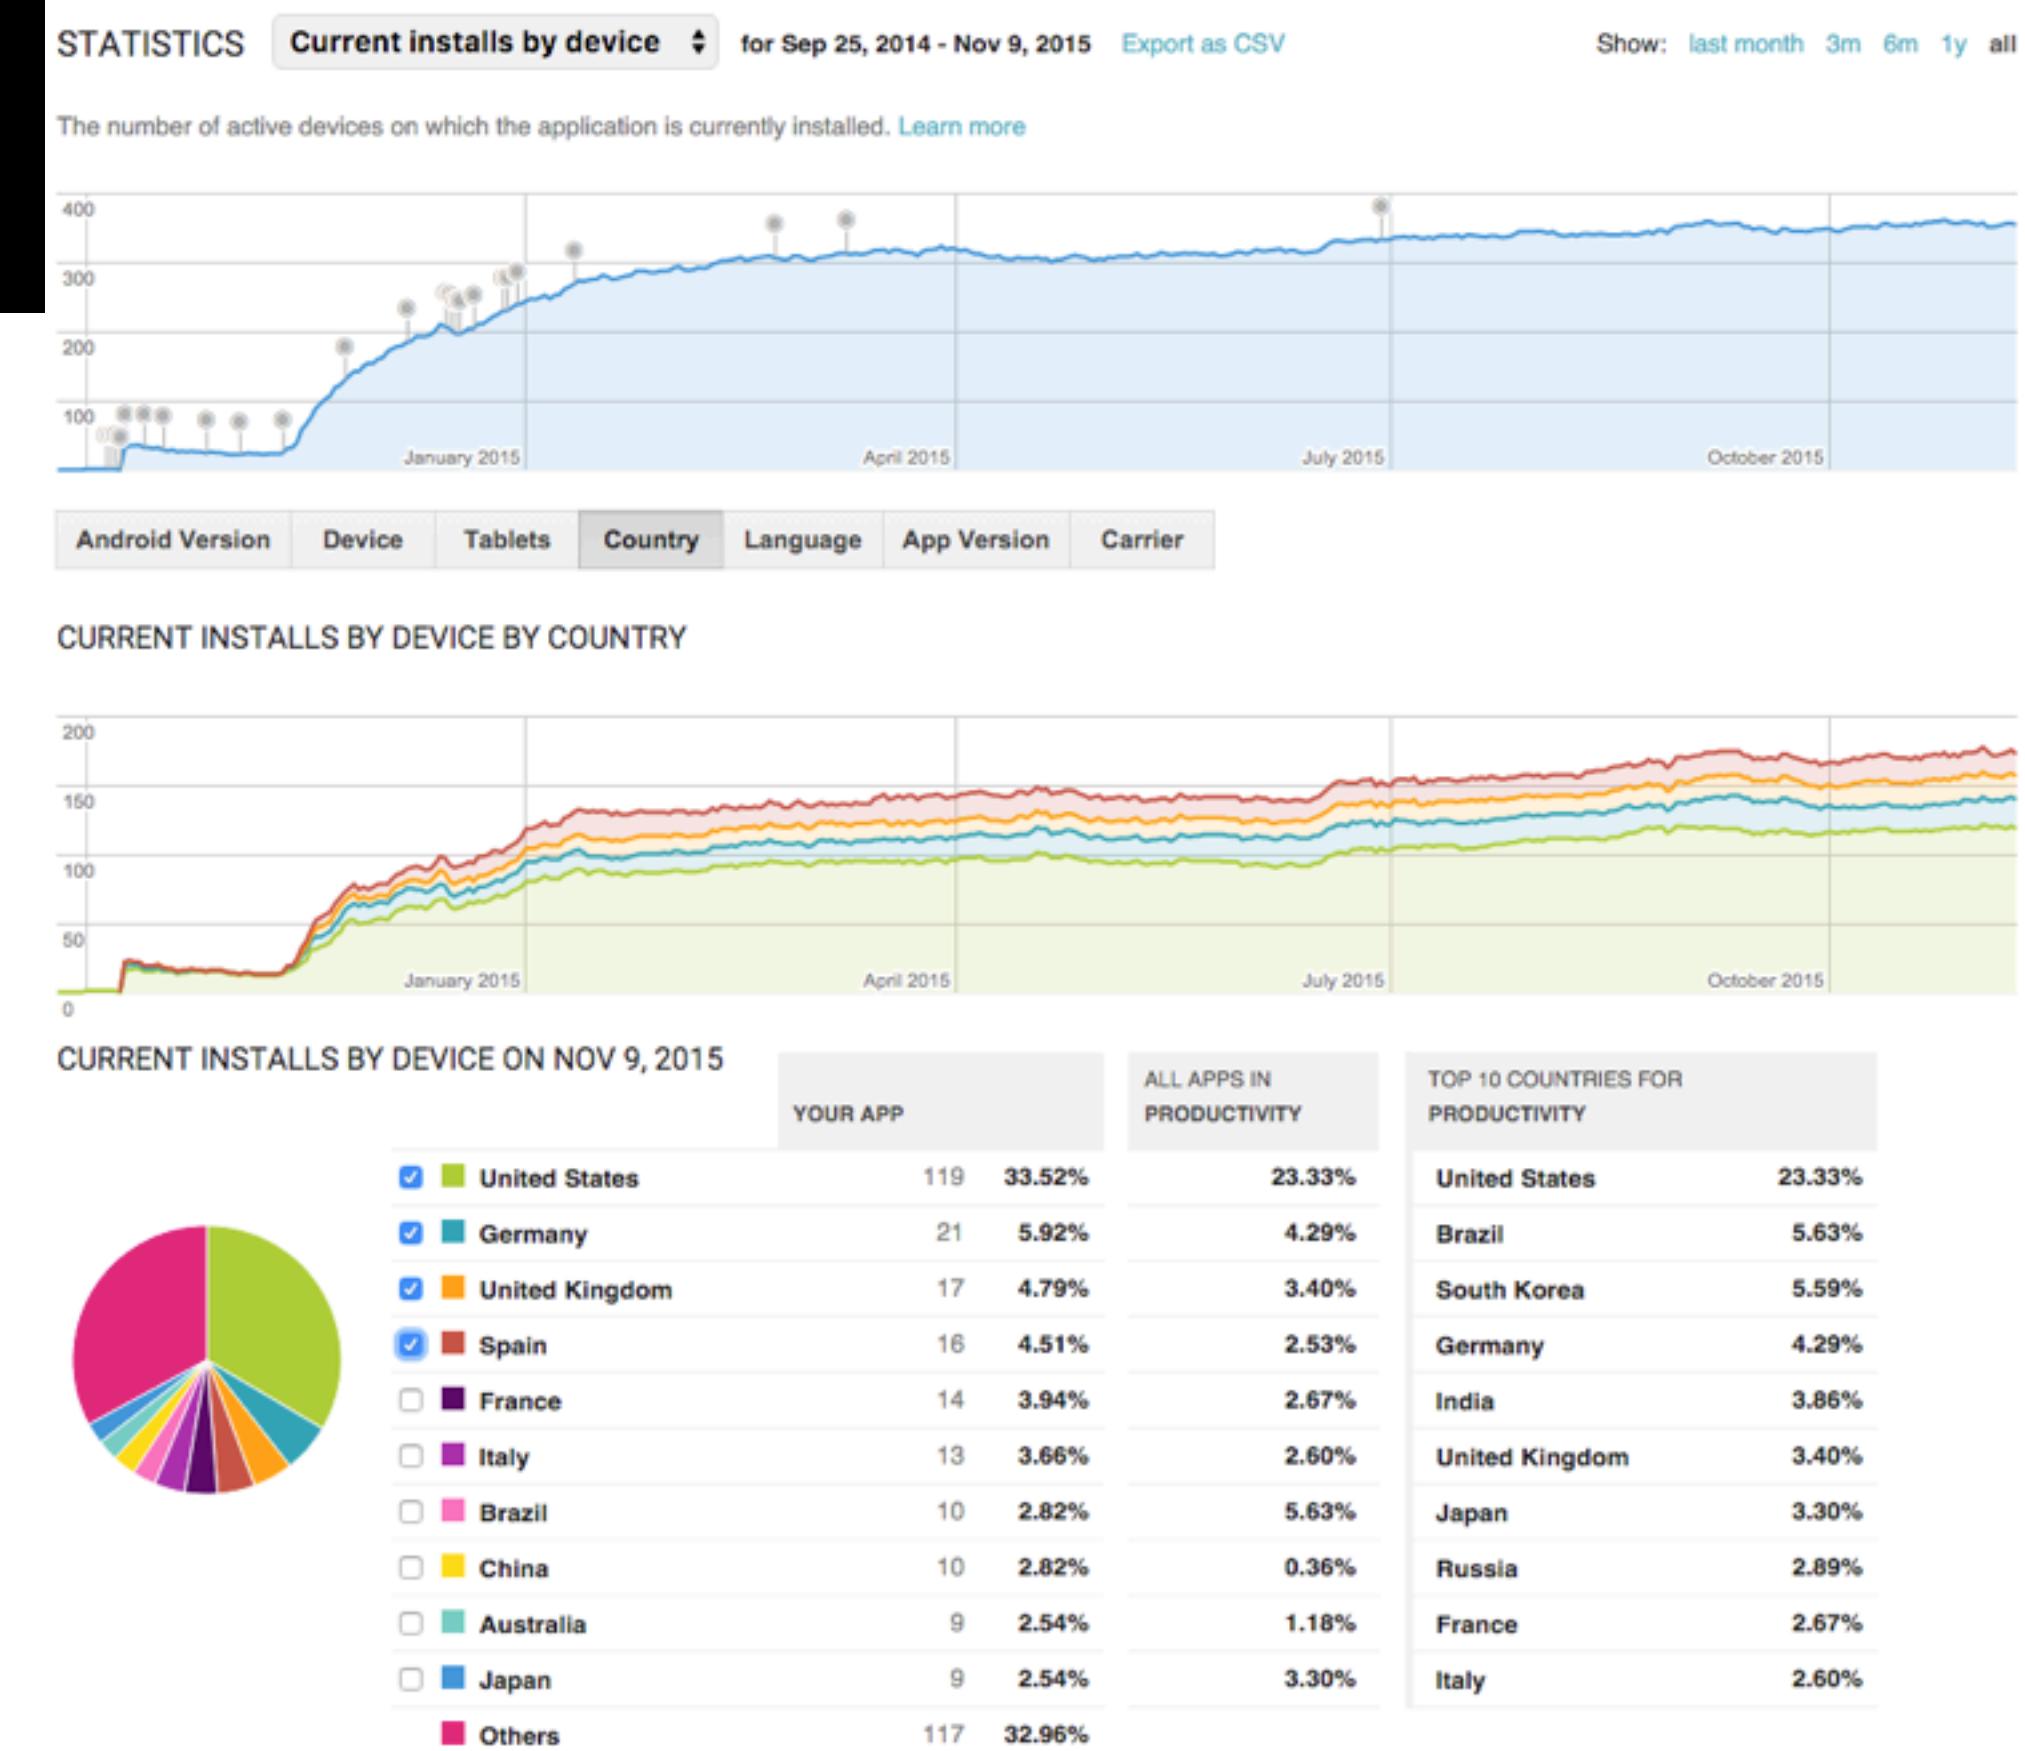

After they made the official APIs, Google promoted “hand picked” watchfaces

CalWatch wasn’t “picked”

Growth is negligible

But it was fun

Cool to have *my* watch running *my* code, showing *my* calendar!

The future of Android?

Google is famously, amazingly secretive about whatever's coming next

Example: What about Java8 support? Dead silence.

The good news: Android's market share is immense

Massive tool support from industry & open source.

Example 1: You like Apple's Swift? Try JetBrains's Kotlin. Built into newer IntelliJ.

Example 2: "Functional-reactive" libraries rather than callbacks (RxAndroid, etc.)

So, even if Google is unhelpful, there's at least a huge community

And some of their advice is occasionally helpful.
